Rational degree is polynomially related to degree

We prove that deg(f) is at most rdeg(f) cubed (up to logarithmic factors) for every Boolean function f, where deg(f) is the degree of f and rdeg(f) is the rational degree of f. This resolves the second of the three open problems stated by Nisan and Szegedy, and attributed to Fortnow, in 1994. [Based on joint work with Robin Kothari, Matt Kovacs-Deak, and Rain Zimin Yang.
